PROFESSIONAL SUMMARY

Full-Stack AI Engineering Lead who builds production software that removes manual work and cuts costs. Built a voice AI platform handling 1,000+ concurrent calls with 40% lower API latency, an invoice-automation tool that replaces manual inbox search and data entry, and ERP features that saved a client 50% or more of their time. Now leading a multi-vendor marketplace across web and mobile, where I cut app startup memory by over 75%.

TECHNICAL SKILLS

AI & LLM: Groq, Gemini, Deepgram Speech-to-Text, LLM system design, Prompt Engineering
Backend: Python, FastAPI, PHP, Node.js, REST APIs, Celery, SQLAlchemy, Alembic
Frontend: Next.js, React, TypeScript, Tailwind CSS, Framer Motion, Three.js
Database & Infra: PostgreSQL, MySQL, MongoDB, Prisma ORM, Redis, Docker
Security & Auth: OAuth 2.0, JWT, Clerk Auth, Rate Limiting, CSRF Protection, CSP Headers, TLS

PROFESSIONAL EXPERIENCE

Zidan - Full-Stack Web & App Developer (Lead), Dubai (Remote) Jul 2026 - Present

* Developing a multi-vendor gifting marketplace across a mobile app and website on a shared PHP/MySQL backend, letting users browse and buy gifts from both company-owned and third-party seller catalogs
* Built the Giftaholic mobile app on the same backend APIs as the website, keeping product, cart and order data consistent across both platforms from a single source of truth
* Cut the Giftaholic app's startup memory from ~800 MB to under 200 MB (over 75% lower) by redesigning the app, removing heavy native dependencies, moving data fetching into individual screens, and unmounting inactive navigation stacks
* Built the third-party seller onboarding page and product-listing flows, extending the platform from a single-catalog store into a full multi-vendor marketplace

Ayvik - Junior AI Full-Stack Engineer, Hyderabad Dec 2025 - Feb 2026

* Architected VANI, an 8-service voice AI microservices platform handling 1,000+ concurrent marketing calls via the Bolna API, built on async SQLAlchemy over PostgreSQL and Celery task queues; cut API latency 40% with Redis caching
* Contributed to the development of a client-facing ERP system covering the entire procurement flow, from master data through the procurement pipeline, saving the client around 50% or more of their time; built its authentication and access-control features and led QA testing across releases

PROJECT EXPERIENCE

InvoiceFlow AI GitHub | Live Jun 2026 - Aug 2026

* Built a full-stack invoice-automation platform that connects Google Workspace, discovers invoice attachments in Gmail, and extracts structured data from PDFs and scans - replacing manual mailbox search and invoice entry with a single review workflow
* Designed a secure, audit-ready pipeline with OAuth read-only Gmail access, AES-256-GCM encrypted refresh tokens and source PDFs, Supabase row-level security, versioned corrections, approval/rejection controls, and signed webhooks
* Automated a 30-day historical backscan and scheduled syncs every 15 minutes; used native PDF parsing with OCR fallback and Groq JSON-schema extraction with confidence scoring to surface invoices for faster human review

HyperDrive AI GitHub May 2026 - Jun 2026

* Built a real-time autonomous lead-generation and outreach engine: a 3-worker BullMQ pipeline turns a natural-language brief into 5-7 targeted searches, filters through 10+ block-lists, crawls up to 200 unique URLs per run, and returns immediately with live progress polling
* Built real-time campaign delivery and engagement tracking with Resend batches of 100 emails/API call and 5 concurrent SMTP connections; added workspace isolation, AES-256-GCM credential encryption, GDPR/CAN-SPAM pre-flight opt-outs, and 5-minute delivered/opened/clicked/bounced status polling

EDUCATION

B.E. Information Technology, Osmania University, Hyderabad Jun 2025
CGPA: 7.04/10 | IELTS: 7.5
